

Hotel Performance Report

Power BI Dashboard Sample:

1. Data Modeling

1.1 Data Model Architecture

The data model follows a **star schema** structure and was extended to support two core business areas: occupancy and revenue performance. Daily Occupancy and Daily Revenue are modeled as separate fact tables, sharing common dimensions such as Date and Property.

1.2 Fact Tables

1.2.1 Fact_Daily_Occupancy

This fact table captures daily operational performance at the room level.

Key Measures:

- Occupancy Rate: Rooms Sold / Rooms Available
- Revenue Per Available Room: Total Room Revenue / Rooms Available
- ADR (Average Daily Rate): Total Room Revenue / Rooms Sold
- Potential Lost Revenue: Unsold Rooms × ADR
- Capacity Utilization Efficiency: Total Room Revenue / (Total Room Revenue + Potential Lost Revenue)

1.2.2 Fact_Daily_Revenue

This fact table captures financial performance and budget comparison.

Key Measures:

- Revenue MoM Growth: $(\text{Current Month Revenue} - \text{Previous Month Revenue}) / \text{Previous Month Revenue}$
- Budget Attainment Rate: Total Revenue / Budget Revenue
- Budget Variance: $(\text{Total Revenue} - \text{Budget Revenue}) / \text{Budget Revenue}$
- Forecast Accuracy Rate: $1 - |\text{Actual Revenue} - \text{Forecast Revenue}| / \text{Forecast Revenue}$
- Forecast Variance: $(\text{Total Revenue} - \text{Forecast Revenue}) / \text{Forecast Revenue}$
- Revenue Share by Segment: Segment Revenue / Total Revenue
- Revenue Share by Department: Department Revenue / Total Revenue
- Daily Average Rate: Total Revenue / Number of Days

2. Financial Performance

2.1 Insights

Revenue declined by **\$3.13M** from 2024 to 2025. In 2024, the hotel group generated **\$84.61M** in total revenue, compared to a \$89.17M budget and \$89.16M forecast, coming in **5.10%** below budget and **5.11%** below forecast, with a budget attainment rate of 94.90%. A nearly identical pattern is observed in 2025. Total revenue reached \$81.48M, against a **\$85.87M** budget and **\$85.88M** forecast, coming in about **5%** below both, with a budget attainment rate of **94.89%**. The Forecast Accuracy Rate also remained consistent across both years.

These results highlight a persistent gap between plan and actual performance. To better understand the source of this gap, further analysis of occupancy, rate performance, and operational efficiency is needed.

2.2 Revenue Breakdown Analysis

In 2024, revenue was evenly distributed across all segments and departments, each contributing around **25%**, so there isn't a single dominant revenue driver. The more noticeable pattern appears in the monthly trend: strong performance early in the year, **a decline from May to August**, followed by recovery in Q4. That **mid-year decline** likely explains most of the overall budget gap. In 2025, the revenue structure remains largely unchanged, and the same seasonal pattern appears again. With both the distribution and timing staying consistent, the decline is primarily driven by recurring seasonal demand pressure rather than changes in revenue composition.

2.3 Profitability

Departmental operating expenses and fixed operating costs would be included to measure profitability alongside revenue through the following metrics. Gross Operating Profit (GOP) would be calculated as total revenue minus departmental operating expenses, while GOPPAR would divide GOP by total available rooms to compare profitability across properties. EBITDA would be evaluated as revenue minus departmental and fixed operating costs, before depreciation and amortization. In

addition to profit levels, margins would also be reviewed to understand profitability relative to revenue. GOP margin would be calculated as GOP divided by total revenue, and EBITDA margin as EBITDA divided by total revenue.

In Power BI, EBITDA would be shown as a KPI card. GOPPAR and margin metrics would be displayed in monthly line charts to show changes over time. Bar charts would compare GOPPAR and EBITDA margin across properties. A waterfall chart based on EBITDA would break down variance versus budget into revenue and cost components.

3. Operational Performance

3.1 Insights

Occupancy remained around **59%** in both years, with only a slight decline in 2025. Rooms sold decreased from **193K to 186K**, consistent with the overall revenue decline. ADR stayed almost unchanged, rising slightly from **329.52** in 2024 to **330.66** in 2025, and RevPAR remained close to **195**. Occupancy and RevPAR were higher early and late in the year and lower from May to August in both years.

At the property level, larger hotels such as Urban Hub Berlin generate higher total revenue but also show higher potential lost revenue, indicating room to improve occupancy. No property stands out as significantly underperforming. Overall, the revenue gap is mainly driven by fewer rooms sold during the mid-year months rather than pricing or operational issues.

4. Recommendations

Since revenue has consistently come in about **5%** below budget in both years, budget targets should be adjusted to better reflect realistic demand patterns, particularly the recurring mid-year slowdown. Financial planning should account for weaker performance from May to August rather than assuming steady growth throughout the year. At the same time, profit margins should be monitored to ensure that stable pricing is not offset by higher operating costs if room sales continue to decline.

To address the mid-year decline in room sales, efforts should focus on strengthening demand during the mid-year period through targeted promotions, group bookings, or corporate partnerships. Since pricing remains stable, the priority should be improving room volume and capacity utilization rather than discounting rates. Larger properties with higher potential lost revenue present the most immediate opportunity for occupancy improvement.
